

Surf clams are often the “fried clams” featured on menus across the country. This is the most important clam species, by volume, in the United States. Surf clams average 4 1/2 to 8 inches across. They’re taken by hydraulic dredges from sand or gravel habitats in depths of 10 to 300 feet. The fast-growing clam matures in five to seven years and is found from Long Island to southern Virginia. More than half come from New Jersey, and New York is a significant contributor. Surf clams are too big and too coarse to be eaten whole like other clams. They are not sold live, either. Instead, they are processed onshore. Two-thirds of the surf clam’s shucked weight is used. Half of that is the “tongue,” which is used primarily for fried clam strips. The other half is the meat that runs around the shell, plus an adductor muscle that opens and closes the shell. It is ground or chopped and used for chowders, bisques and sauces.

PRODUCT PROFILE

Surf clams offer little waste: Shells serve as containers for stuffed dishes, and the twin adductor muscles (white cylinders attached to the shell) are delicious, as is the juice, or “nectar.” These clams are less flavorful than hardshells. Cooked, the chewy white meat is mild and sweet. Raw meat is whitish-orange. Cooked meat ranges in color from ivory to golden yellow, with some dark areas. Canned clams should be in clear to opaque liquid. Breeding should be intact on breaded product.

COOKING TIPS

This is not a clam to consider steaming or frying whole. It is generally shucked and minced for use in chowders, baked stuffed clams and the like. Minced or chopped meat is excellent in chowder, white sauces or with pasta dishes like clam linguine. The fleshy foot can be cut into strips for frying. The clam’s juice is also great as an additive to soups, stews and seafood dishes.
